

INITIATION OF COVERAGE • IPO ANALYSIS • 21 SEPTEMBER 2026

Oura Inc.

NASDAQ: OURA (PROPOSED)

A category-defining product at a full price: the IPO range already discounts something close to our bull case.

Executive Summary

Oura is the rare consumer-hardware story that has become a genuinely good business. Revenue has more than tripled in two years, reaching \$1.42 billion over the last twelve months. Paid members doubled year over year to 5.0 million. The subscription that sits on top of the ring earns an 89% gross margin, and roughly 85% of members are still paying twelve months after they sign up. Hardware gross profit more than covers sales and marketing, so each new member arrives effectively pre-paid.

The issue is price, not quality. At the \$42 midpoint the fully diluted equity value is about \$14.9 billion. That is roughly 10.5x trailing sales, about 150x trailing adjusted EBITDA and about 250x trailing GAAP earnings. The trailing sales multiple is in line with Apple's and 60% above Garmin's and DexCom's, both of which earn around 30% EBITDA margins against Oura's 7%. Working backwards, \$42 requires roughly \$4.9 billion of revenue in fiscal 2030 (~32% compound annual growth from FY26E) at a 31% adjusted EBITDA margin with ~22 million paid members. That is well above our base case and close to our bull case.

We blend a DCF with an exit-multiple method across three scenarios. That gives a probability-weighted value of **\$32 per share**, with our base case at \$29. We initiate at **Neutral**. We like the asset and would become buyers in the high-\$20s to low-\$30s. Three things argue against chasing the deal: the primary raise is almost entirely consumed by RSU tax withholding, early-stage holders are exiting, and the most recent quarter showed an operating loss.

WHAT WE ARE WATCHING

Upside: a membership price increase (flat at \$5.99 per month since launch), faster international uptake of Ring 5, and FDA clearance of a blood-pressure feature. The healthcare channels (Eli Lilly, Dexcom, employers) could also become a second growth engine. **Downside:** the Samsung ITC patent action, Oura Ring 4-style warranty problems, falling revenue per ring, and a staggered lock-up that makes ~284 million shares eligible for sale within six months.

1. The Company and the Offering

Oura was founded in Finland in 2013 and pioneered the smart-ring category; it is now on its fifth ring generation. The ring tracks sleep, heart rate, heart-rate variability, temperature, activity and female cycle signals. A paid membership (\$5.99 per month or \$69.99 per year in the US) unlocks the scores, trends and AI-driven guidance that make the data useful. The company redomiciled to Delaware in March 2026 and is headquartered in San Francisco. CEO Tom Hale, formerly President of SurveyMonkey (Momentive) and COO of HomeAway, has led the business since March 2022.

The deal is 50 million shares at \$40–44. Only 13.5 million are new shares; the other 36.5 million come from selling holders. Two features of the structure matter for investors:

- **The company is raising almost no growth capital.** Of ~\$533 million of net primary proceeds at the midpoint, about \$526 million goes to paying withholding tax on ~25.5 million RSUs that vest when the IPO is effective. The IPO is effectively a liquidity event. That is not a red flag in itself, since Oura generated \$328 million of operating cash flow in the first nine months of FY26. But it means new shareholders are funding employee tax bills, not the business.
- **Early holders are selling.** Forerunner Ventures, the 2020 Series B lead, is selling its entire 28.7 million-share stake (about \$1.2 billion at the midpoint). Lifeline Ventures, the seed investor, is selling about 31% of its position. On the other side, Fidelity (10.4% post-deal) and Bedford Ridge (8.9%) are selling nothing. Eli Lilly has indicated interest in \$100 million of stock and Dragoneer in \$300 million, which covers roughly 19% of the base deal.

The price range represents a ~57% step-up from the September 2025 Series E (\$26.79 split-adjusted, which valued the company at roughly \$11 billion). Oura has also been an aggressive buyer of its own stock. In the nine months to June 2026 it repurchased roughly \$0.9 billion of common and preferred stock, funded partly by a \$375 million draw on its revolving credit facility. The \$985 million "deemed dividend" in the income statement is the premium paid on those preferred-share repurchases above book value; it reflects capital returned to holders, not an operating cost. After the offering, cash of roughly \$378 million offsets ~\$380 million of debt, so enterprise value and equity value are essentially the same.

2. Business Model and Unit Economics

The model is "hardware plus subscription" in the mold of Peloton or Whoop, with one important difference: the hardware is profitable. Over the first nine months of FY26, rings generated average revenue per unit (RPU) of \$311, and we estimate hardware gross margin at ~46% after warranty costs. That is roughly \$143 of gross profit per ring, against about \$83 of sales and marketing spend per ring sold. Management describes this as recovering customer acquisition cost on day one. The numbers support that claim, though they will deteriorate if promotions deepen or channel mix shifts further toward retail, which already accounts for 49% of hardware revenue.

UNIT ECONOMICS (9M FY26 UNLESS NOTED)	VALUE	COMMENT
Ring revenue per unit	\$311	Down from \$326 (FY25) and \$332 (FY24): mix, retail, promotions
Hardware gross profit per ring (est.)	~\$143	~46% hardware gross margin; ~51% in Q3 FY26 after Ring 5 launch
Sales & marketing per ring sold	~\$83	\$258M S&M ÷ 3.1M rings; ~40% of members acquired organically
Ring activation → paid member conversion	>94%	30-day free trial; membership required for most features
Membership revenue per member (Q3 annualised)	~\$77	63% of new members choose the annual plan
Membership gross margin	89%	Hosting, data processing, support
12-month paid retention (weighted)	~85%	Improving cohort-over-cohort: 81% (FY23) → 87% (9M FY25)
Implied member gross-profit lifetime value (est.)	~\$300	\$69/yr gross profit, 15% annual churn, 10% discount rate

The lifetime value math explains the valuation debate. A ring sale that breaks even on acquisition cost and then produces ~\$300 of discounted high-margin subscription profit is a very good trade. Repeat purchases make it better: they were 11% of rings sold in 9M FY26, up from 5% in FY24, and the FY23 cohort has bought over 30% more rings since first activation. The weak points are that revenue per ring is falling, and that 77–80% of revenue still comes from a discretionary, launch-driven hardware cycle.

3. Historical Performance

Source: Oura S-1/A (21 Sep 2026); LTM and Q3 figures derived by Big Blind Capital from quarterly disclosures.

Growth is real and broadening. Revenue grew 123% in FY25 and 74% in the first nine months of FY26. Membership revenue is compounding faster than hardware: it grew 121% year over year and has risen from 12% of revenue in Q1 FY25 to 23% in Q3 FY26. Paid-member growth has exceeded 100% for seven straight quarters, and management expects ~5.7 million members at fiscal year-end (+96%). Aided brand awareness in the US has risen from ~15% to ~38% since early FY24, which still leaves substantial room to grow.

Margins are the open question. Gross margin fell from 65% in FY24 to 52% in FY25. The cause was an \$84 million jump in warranty expense tied to battery failures in certain Oura Ring 4 production cohorts, plus a costlier all-titanium bill of materials. It has since recovered to 60% in Q3 FY26 as Ring 5 ramped and membership mix rose. Operating leverage has been less consistent: operating expenses fell from 62% of revenue in FY24 to 47% in FY25, then rose back to 49%. The June quarter swung to a \$5 million operating loss as Ring 5 launch marketing coincided with litigation and IPO costs.

Earnings quality needs adjusting. Reported profitability is flattered by very low stock-based compensation, only ~\$10 million in 9M FY26. That is because performance-vesting RSUs have not been expensed pending the IPO. About 37.5 million such awards are outstanding, and we estimate a one-time catch-up charge well above \$100 million at listing, followed by a much higher run-rate afterwards. We model stock-based compensation at ~5% of revenue going forward. Operating cash flow was also boosted by working capital (inventory wind-down, deferred revenue and payables), so trailing free cash flow of ~\$230 million overstates the steady-state level.

4. Market and Competitive Position

Oura sold 3.6 million rings over the last twelve months, about 2% of the ~212 million wearables shipped globally according to IDC. Its broader addressable-market claim is ~\$90 billion of "serviceable" spend across fitness tracking, coaching, digital care management and biosensors. We treat that figure as aspirational: most of it is healthcare spend that Oura has not yet shown it can capture. The more relevant point is that Oura is expanding the category as well as taking share. One-third of new members say Oura is their first wearable, 72%

of members are women, and more than half report at least one chronic condition. That demographic and use-case profile differs from Garmin's or Whoop's performance-athlete base.

The competitive field is getting crowded. Samsung's Galaxy Ring charges no subscription, and cheaper rivals such as Ultrahuman and RingConn compete on price. Apple Watch, Google/Fitbit, Garmin and Whoop compete for the same wrist-or-finger decision. Oura's defenses are real: a patent portfolio of 1,140+ patents and applications, measurement-accuracy leadership, ~23 hours of median daily wear, and a 42-billion-hour longitudinal data set. None of these is permanent, though. Samsung's December 2025 ITC complaint, which seeks import restrictions on certain Oura products, shows that the patent fight runs in both directions.

EXHIBIT 3: EV / LTM SALES VS. GROWTH, CONSUMER-HEALTH PEERS

Source: Yahoo Finance (21 Sep 2026); Oura S-1/A. Peer growth is most recent quarter YoY.

Where Oura sits. Oura is growing five to six times faster than the premium hardware peers (Apple, Garmin, DexCom), and the market pays those peers 6.6x–10.6x trailing sales. By that yardstick a double-digit multiple is defensible for growth alone.

The problem is that those peers earn 28–36% EBITDA margins today, while Oura earns about 7%. On forward EBITDA and earnings, Oura screens at roughly two to five times the peer multiples even in our base case.

The cautionary cases are hardware-subscription companies that lost their growth: Peloton (1.1x sales), GoPro (0.5x), Sonos (1.1x) and Fitbit, which Google acquired for \$2.1 billion, about 1.5x sales. When the device cycle stalls, the market re-rates these companies abruptly.

COMPANY	MKT CAP (\$B)	EV / LTM SALES	EV / LTM EBITDA	P/E LTM	P/E FWD	REV. GROWTH	GROSS MGN	EBITDA MGN
Apple	4,947	10.6x	29.3x	38.9x	35.4x	16%	49%	36%
Garmin	54.1	6.6x	21.8x	28.9x	25.5x	11%	60%	30%
DexCom	33.6	6.7x	23.6x	35.2x	28.5x	13%	62%	28%
Hims & Hers	6.8	2.8x	n.m.	n.m.	35.9x	38%	70%	0%
Peloton	2.2	1.1x	10.6x	35.4x	21.5x	0%	53%	10%
Sonos	1.9	1.1x	14.7x	36.4x	12.5x	9%	45%	7%
GoPro	0.3	0.5x	n.m.	n.m.	n.m.	(31%)	28%	(19%)
Oura @ \$42 (FD)	14.9	10.5x	152x	252x	126x*	74%	55%	7%

Source: Yahoo Finance as of 21 Sep 2026 (intraday); Oura S-1/A; Big Blind Capital estimates. * Oura forward P/E on base-case FY27E GAAP EPS of \$0.33, which includes ~5% of revenue in stock-based compensation.

5. Forecasts and Scenarios

We build revenue from its drivers: rings sold × revenue per ring for hardware, and average paid members × revenue per member for membership. The member base rolls forward from rings sold, net of repeat buyers

and 94% activation conversion, less churn. For FY26E we estimate Q4 revenue of ~\$400 million. That reflects the first full quarter of Ring 5 and ~0.7 million net member additions to reach the 5.7 million guide, and gives \$1.62 billion for the year (+78%).

EXHIBIT 4: REVENUE BY SCENARIO, FY24A-FY30E (\$B)

Source: Oura S-1/A; Big Blind Capital estimates.

KEY ASSUMPTIONS / OUTPUTS	BEAR	BASE	BULL
Rings sold growth, FY27 → FY30	+10% → 0%	+30% → +10%	+42% → +16%
Revenue per ring (FY30)	\$275	\$312	\$325
Annual churn / membership revenue per member (FY30)	20% / \$78	14% / \$86	11% / \$100
Hardware gross margin (steady state)	40%	48%	50%
Opex incl. stock comp, % revenue (FY30)	50%	44%	40%
FY30E revenue (\$B) / CAGR from FY26E	\$2.1 / 7%	\$3.9 / 25%	\$5.6 / 36%
FY30E paid members (M) / membership mix	11.4 / 40%	19.0 / 38%	24.8 / 39%
FY30E gross margin / adj. EBITDA margin	59% / 17%	64% / 27%	66% / 33%
FY30E GAAP EPS (FD, 1.5% annual dilution)	\$0.41	\$1.59	\$2.98
Blended value per share (DCF / exit multiple)	\$6	\$29	\$67
Probability weight	25%	50%	25%

Base case. Revenue grows 39% in FY27 as Ring 5 cycles through a full holiday season and international expansion continues. Growth then slows to 26%, 20% and 15%, for a FY30 total of \$3.9 billion. Membership rises to 38% of revenue, which lifts gross margin to ~64% and adjusted EBITDA to 27% by FY30. We hold subscription pricing roughly flat, allowing only modest mix and international uplift. We assume no revenue from medical-device features, healthcare or payer partnerships beyond today's run-rate.

Bull case. Oura wins the ring category outright and executes internationally. It also raises membership pricing, reaching ~\$100 of revenue per member, and churn falls to 11% as health features deepen the product's hold on users. Paid members reach ~25 million and FY30 revenue \$5.6 billion, with adjusted EBITDA margins in the mid-30s, similar to Garmin and Apple.

Bear case. Ring units plateau at ~4.7 million a year from FY28, as has happened in other device categories. Samsung and low-cost rivals compress revenue per ring toward \$275, and warranty or tariff costs hold hardware margin near 40%. The installed base keeps membership revenue growing, but total revenue stalls near \$2.1 billion. This is not a collapse scenario; it is a GoPro- or Peloton-style re-rating of a still-profitable business.

6. Valuation

We value Oura with two methods, averaged within each scenario. The first is a ten-year DCF: explicit forecasts for FY27–FY30, then a five-year fade to a terminal growth rate. The base case uses a 10.0% WACC and 3.5% terminal growth, with stock-based compensation treated as a real cost. The second applies an FY30 EV/EBITDA exit multiple (10x / 16x / 20x across the three scenarios), discounted back at the same WACC. The DCF is the more conservative of the two because roughly two-thirds to three-quarters of its value sits in the terminal value, which is capped by a mature-business perpetuity. The exit multiple assumes the market will still pay a growth premium in 2030.

EXHIBIT 5: VALUATION SUMMARY, PER SHARE (FULLY DILUTED)

Source: Big Blind Capital estimates. Peer multiples: Garmin, DexCom and Apple (low-high). Base-case inputs unless noted.

BASE DCF, \$/SHARE: WACC (ROWS) × TERMINAL GROWTH						BASE EXIT VALUE, \$/SHARE: WACC × FY30E EV/EBITDA					
	2.5%	3.0%	3.5%	4.0%	4.5%		12X	14X	16X	18X	20X
9.0%	\$25	\$26	\$28	\$31	\$34	9.0%	\$26	\$30	\$35	\$39	\$43
9.5%	\$23	\$24	\$26	\$28	\$30	9.5%	\$26	\$30	\$34	\$38	\$43
10.0%	\$21	\$22	\$24	\$25	\$27	10.0%	\$25	\$29	\$33	\$38	\$42
10.5%	\$19	\$21	\$22	\$23	\$25	10.5%	\$25	\$29	\$33	\$37	\$41
11.0%	\$18	\$19	\$20	\$21	\$23	11.0%	\$24	\$28	\$32	\$36	\$40

Only the bull scenario, the top of the trailing-sales range and a 20x base-case exit multiple reach the IPO range; everything else sits below it. The trading-comp methods look unfavorable because Oura's current margins are so far below its peers'. That gap is the core of the bull thesis, but it has not been demonstrated yet. The base-case exit method gets to the low \$40s only with a 20x terminal EBITDA multiple, which is Garmin-plus territory for a company that would still be mostly a hardware business in 2030.

What the price implies. Moving our inputs from base toward bull, \$42 is reached roughly 60% of the way there. That implies FY30 revenue of ~\$4.9 billion, ~22 million paid members and a ~31% adjusted EBITDA

margin. None of those is implausible for a company that has tripled revenue in two years. They do, however, require near-flawless execution through at least two more hardware cycles, a subscription price increase, and no significant setback from Samsung or Apple. We would rather pay for the base case and get the bull case as a free option.

Fair value \$32; Neutral. A 25/50/25 weighting of bear, base and bull gives \$32, about 24% below the midpoint. Deals like this frequently trade up on the first day, and the price-based lock-up releases (triggered at +25%, +33% and +40% above the IPO price) are designed to supply stock into any such rally. We would revisit below ~\$30. We would also revisit if the first two public quarters show gross margin holding near 60% while opex leverage resumes.

7. Key Opportunities

- **Pricing power on the subscription.** The \$5.99 monthly price has not changed since 2021, even as features such as Oura Advisor (AI coaching), meal logging, Dexcom glucose integration and in-app blood panels have been added. Every \$1 per month across ~5.7 million members is worth ~\$68 million of annual revenue at ~89% gross margin. That is roughly two-thirds of LTM adjusted EBITDA, which makes pricing the single largest lever not in our base case.
- **International growth is still early.** Less than 20% of hardware revenue comes from outside the US, despite a presence in 56 markets. Management's approach is to prove demand direct-to-consumer, then add retail. Getting even to Garmin-like international exposure would add years of growth.
- **Healthcare, employer and payer channels.** Partnerships with Eli Lilly's LillyDirect platform, Dexcom and Resmed, together with FSA/HSA eligibility and enterprise and government deployments, position Oura for subsidized or reimbursed adoption. That would bring lower acquisition costs and stickier members. Lilly's \$50 million SAFE investment and \$100 million cornerstone interest signal that this is strategic for them, not a marketing tie-in.
- **Regulated health features.** A blood-pressure study with 350,000+ participants could support an FDA-cleared hypertension feature. A clearance would be a clear differentiator from general-wellness rivals and a route toward clinical reimbursement.
- **Repeat-purchase cycle.** Upgrades rose from 5% of units in FY24 to 11% in 9M FY26. As the 2023–2025 cohorts reach upgrade age, a growing installed base should make hardware revenue less dependent on new-customer acquisition.

8. Key Risks

- **Hardware cycle concentration.** 77–80% of revenue is hardware, sold mostly around launches and the December quarter. A weak product generation, or a quiet year between launches (see Q4 FY25: revenue down 10% sequentially), feeds straight into results. Revenue per ring has fallen for two consecutive years.
- **Competition from very large players.** Samsung's ring requires no subscription, Apple has the installed base to enter at will, and Ultrahuman and RingConn undercut on price. Competitors that discount hardware or drop subscription fees are the greatest threat to both hardware margin and the membership thesis.

- **Intellectual property and litigation.** Samsung's ITC complaint (four patents) could, in the worst case, restrict imports of certain products. Separately, Omni MedSci seeks ~\$120 million in a patent suit. Former CEO Harpreet Rai has filed suits alleging securities fraud in connection with his 2024 share repurchase agreement, and Peter Attia's equity-compensation claim goes to trial in February 2027. Litigation costs already pushed G&A to 14% of revenue in Q3 FY26.
- **Quality and warranty.** The Ring 4 battery problem cost ~\$84 million of incremental warranty expense in FY25, roughly 9 points of that year's gross margin. Ring 5 launched in June 2026, and any repeat problem would hit margins, trust and member retention.
- **Tariffs and supply chain.** Production relies on a limited number of contract manufacturers and some single-source components across Finland, Estonia, Mexico, South Korea and China, and the titanium content is exposed to metals tariffs. Oura has little room to absorb tariffs at \$349–\$499 retail price points without hurting unit volumes.
- **Supply of stock and governance.** The staggered lock-up makes ~284 million shares eligible for sale in tranches starting as early as day 35, with price-triggered early releases on top. Post-IPO stock-based compensation will reset reported earnings materially lower. Before its public debut, the company also extended \$3.5 million of personal loans to its CFO, which is unusual: loans to executive officers are generally prohibited for public companies under Sarbanes-Oxley.
- **Regulatory perimeter.** Oura markets most features as general wellness, outside FDA device rules. Moving further into blood-pressure and clinical insights raises FDA and FTC scrutiny of accuracy claims, which are already the subject of consumer class-action risk.

9. Conclusion and Catalysts

Oura has built what most hardware companies never achieve: a product people wear 23 hours a day, pay for monthly, and recommend to others. The operating metrics (85% retention, 65% daily/monthly active-user ratio, 40% organic acquisition, hardware that funds its own marketing) are best-in-class for consumer health. We expect to own this stock at some point. At \$40–44, though, investors are paying today for fiscal-2030 execution that is closer to our bull case than our base case, in a deal that raises almost no growth capital and gives early holders an exit. We initiate at **Neutral with a \$32 fair value**.

CATALYST	TIMING	WHAT WOULD CHANGE OUR VIEW
Pricing and first-day trading	Week of 28 Sep 2026	A price above range would widen the gap to fair value
First public quarter (Q4 FY26) and FY27 outlook	~Nov 2026	Paid members ≥5.7M; gross margin ≥58%; opex leverage returning
Holiday quarter (Q1 FY27), first full Ring 5 season	~Feb 2027	Rings sold ≥1.8M; revenue per ring stable at or above \$311
Samsung ITC initial determination	2027	A negative ruling or import exclusion would move us toward the bear case
Membership price or tier changes	Any time	A +\$1–2/month increase with churn held would move us toward the bull case
Lock-up releases	Day 35 → Day 181	Technical pressure; potential entry point

SOURCES AND DISCLOSURES
